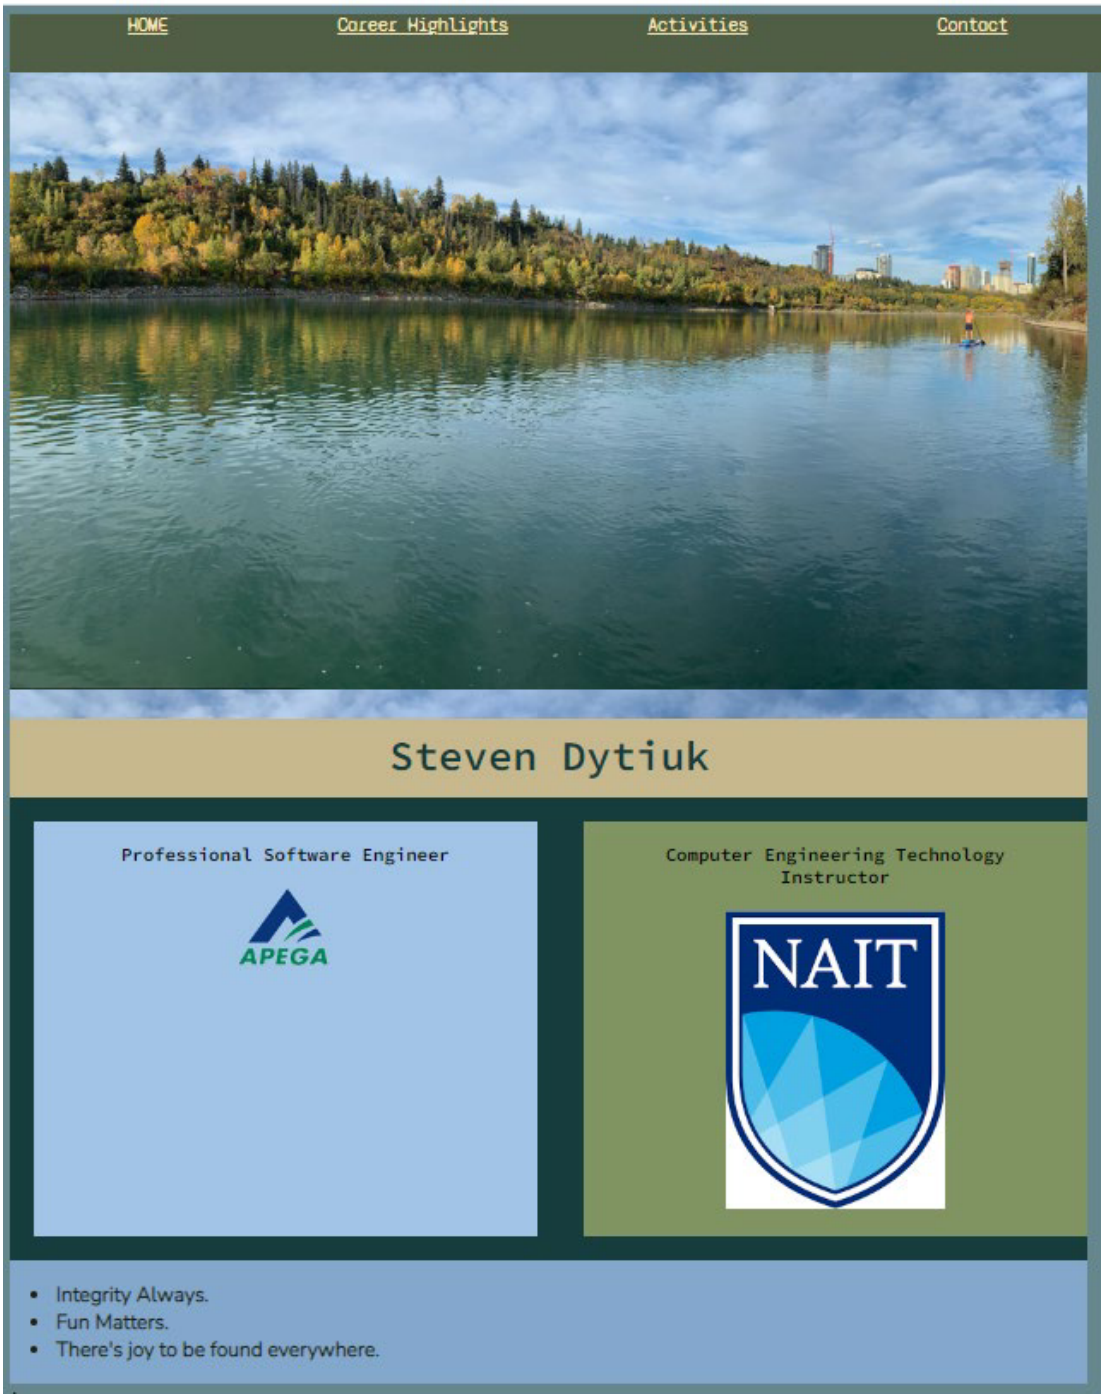
CMPE 2000 Lab 1
Your Personal Website on GitHub



This is your opportunity to start a personal website hosted on GitHub. You are encouraged to improve on it as you progress in CNT and through your career – this is just the start! This website's target

audience would be professional connections and future employers – and would hopefully give you that added edge!

PART A: Research (10%)

For each of the considerations below, do some research and record some points about how you will apply what you read to your website:

1. Personal Privacy
2. What to put on a personal website
3. What not to include on a personal website

You must specify the articles that you have read that pertain to the above:

* 5 Do's & Don'ts of Creating a Personal Website to Showcase Your Professional Achievements
* 5 Types of Information You Should Never Post Online
* The Top 10 Dos & Don'ts for Website Building
*

PART B: Website Structure and Planning (20%)

Based on the research performed in Part A, create a **mockup** of your personal website. Refer to the specifications in PART C for minimum expectations. Max 10% will be given if your mockup doesn't look similar to your actual website.

PART C: The Website Build (60%)

1. Create your website using your public GitHub webspace (https://pages.github.com/)
2. Only HTML, CSS and JavaScript are allowed for this lab. HTML5 tags must be used appropriately.
3. Mobile-first design is a must
4. Grid is required on one or more pages
5. All pages must have a common theme and point to the same style.css
6. Your site must be your own original design and work

PART D: Reviews (10 %) – done after PART A, B, C are completed

Review 5 of your classmates' pages – these will be assigned IN CLASS – you may not select your own. Provide feedback/suggestions on their pages and submit the feedback to the instructor. You will get 2 marks for each legitimate feedback that you provide: 1 mark for feedback about the aesthetics and 1 mark for feedback on technical aspects.
